

NEWS FROM...

This week we have heard how our friends in Mikute have been learning from grafting experts how to grow their own food.

What is grafting?

Grafting is the act of placing a portion of one plant (bud or scion) into or on a stem, root, or branch of another (stock) in such a way that a union will be formed and the partners will continue to grow.

Good afternoon my friends,

I hope you are all doing well. That's my hope. Today we had grafting experts who came to train us at Mikute. It was very interesting to do it practically. Her description, she says that the new bud to be grafted has the genes that enables it to determine when to start flowering. So it supports by proving food nutrients to the bud.

We aim to challenge the community in the verge of teaching them that it is possible to plant trees in this difficult moment where the country is facing a lot of environmental degradation alongside global warming through deforestation.

In this garden we have bananas, mangoes, guavas and oranges... Next week we shall start constructing the fence.
